// To re group into numeric the variable parameter

egen (proposed variable) = group(the existing variable as a parameter)

in this example

egen countrynum = group(A)

// To check whether the data is fit with the

countrynum list A

countrynum in 1/10, sepby (A)

// To prepare based on the group of parameter

xtset (variable of group)

xtset countrynum

// To set the group yearly

xtset countrynum (the yearly variable), yearly xtset countrynum B, yearly

// to regres this panel data

xtreg (dependent variable) (independet variable and the rest)
